AI-Driven Autonomous Security Operations Center

Comprehensive Project Architecture & Source Code Documentation

A Full-Stack Cybersecurity Platform Integrations: Llama-3 LLM, Reinforcement Learning, Federated Learning, and Machine Learning Anomaly Detection

Final Project Documentation Report

1. Executive Summary

This project represents a full-stack, AI-Driven Security Operations Center (SOC). It transcends traditional signature-based dashboards by integrating multiple advanced paradigms: Large Language Models (LLMs) for natural language reasoning, Q-Network Reinforcement Learning (RL) for adaptive firewall policies, Federated Learning (FL) for privacy-preserving intelligence without sharing raw data, and Deep Machine Learning (Isolation Forests and Fuzzy C-Means) for zero-day threat detection.

The platform is designed natively in Python utilizing a Modular Monolith architecture. The backend is powered by Supabase (PostgreSQL) for centralized, concurrent cloud state logic, whilst the frontend is driven by an ultra-customized Streamlit application featuring dynamic Plotly visualizations, React-wrapped components, and an immersive user interface.

This document serves as the exhaustive architectural breakdown, containing the programmatic source code, implementation methodologies, API integrations, and systemic logic forming the core of the SOC prototype.

2. Core System Architecture & Technologies Used

Frontend Presentation Layer: Streamlit, Plotly, HTML/CSS
State Persistence Layer: Supabase (PostgreSQL), bcrypt
AI Intelligence Engine: Groq API (Llama-3-70b), scikit-learn, Numpy
Models Implemented: Deep Q-Networks (RL), Isolation Forest, Fuzzy C-Means, Federated Averaging
External Integrations: VirusTotal API, AbuseIPDB API, AlienVault OTX API
Orchestration: Docker, ReportLab

3. Frontend User Interface Modules (Streamlit Pages)

Module: 00_User_Guide.py

Path: pages/00_User_Guide.py

Implementation Outline: This module handles the execution logic and state management for 00_User_Guide.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (00_User_Guide.py):

```
import streamlit as st
import os
import sys

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

from ui.theme import CYBERPUNK_CSS, inject_particles, page_header, section_title
st.markdown(CYBERPUNK_CSS, unsafe_allow_html=True)
inject_particles()

st.markdown(page_header("Command Manual", "Official Guide to the Autonomous SOC Platform"), unsafe_allow_html=True

# ━━━
```

```
        "content": """
        ### Triage &amp; Response
        Located in the 'Monitoring' category, the Alerts page is your operational hub.

        - **Active Alerts**: Latest threats requiring attention.
        - **Filtering**: Search by Severity, Source IP, or Status.
        - **Investigation**: Each alert includes a 'Risk Score' derived from ML clusters.
        """,
        "tip": "Always prioritize **CRITICAL** severity alerts first."
    },
    "CORTEX AI": {
        "emoji": "■",
        "content": """
        ### Neural-Link Investigation
        CORTEX is your intelligent assistant. It is directly connected to the SIEM and Threat Intel feeds.

        **Try asking:**
        - "What are the latest critical threats?"
        - "Analyze the reputation of IP 8.8.8.8"
        - "Suggest a playbook for SQL Injection"
        """,
        "tip": "CORTEX uses real-world data from VirusTotal, AbuseIPDB, and AlienVault OTX."
    },
    "Active Firewall": {
        "emoji": "■■",
        "content": """
        ### Integrated Defense
        The platform features an active **Web Application Firewall (WAF)**.

        - **Payload Scanning**: Automatically blocks SQL Injection and XSS attempts.
        - **IP Reputation**: Blocks known malicious IPs dynamically.
        - **Audit Logs**: Every block is recorded in the SIEM for full transparency.
        """,
        "tip": "Manage active blocks and overrides in the 'Firewall Control' page (Admin only)."
    }
}

Module: 03_Alerts.py

Path: pages/03_Alerts.py

Implementation Outline: This module handles the execution logic and state management for 03_Alerts.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (03_Alerts.py):

```
"""

Module: 06_Threat_Intel.py

Path: pages/06_Threat_Intel.py

Implementation Outline: This module handles the execution logic and state management for 06_Threat_Intel.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (06_Threat_Intel.py):

```
import streamlit as st
import pandas as pd
import numpy as np
import plotly.graph_objects as go
from datetime import datetime
import random
import os
import sys

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

try:
    st.set_page_config(page_title="Threat Intelligence | SOC", page_icon="", layout="wide")
except st.errors.StreamlitAPIException:
    pass  # Already set by dashboard.py

Module: 07_Geo_Predictions.py

Path: pages/07_Geo_Predictions.py

Implementation Outline: This module handles the execution logic and state management for 07_Geo_Predictions.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (07_Geo_Predictions.py):

```
"""

Module: 08_Kill_Chain.py

Path: pages/08_Kill_Chain.py

Implementation Outline: This module handles the execution logic and state management for 08_Kill_Chain.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (08_Kill_Chain.py):

```
import streamlit as st
import sys
import os
import random
import time
from datetime import datetime, timedelta

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

from ui.theme import CYBERPUNK_CSS
from services.database import db

st.markdown(CYBERPUNK_CSS, unsafe_allow_html=True)
from ui.theme import MOBILE_CSS
st.markdown(MOBILE_CSS, unsafe_allow_html=True)

Module: 12_SOAR_Workbench.py

Path: pages/12_SOAR_Workbench.py

Implementation Outline: This module handles the execution logic and state management for 12_SOAR_Workbench.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (12_SOAR_Workbench.py):

```
import streamlit as st

Module: 13_Forensics.py

Path: pages/13_Forensics.py

Implementation Outline: This module handles the execution logic and state management for 13_Forensics.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (13_Forensics.py):

```
"""

Module: 15_Scanners.py

Path: pages/15_Scanners.py

Implementation Outline: This module handles the execution logic and state management for 15_Scanners.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (15_Scanners.py):

```
import streamlit as st
import os
import sys
import json
import tempfile
import requests
import base64
from datetime import datetime

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

try:
    st.set_page_config(page_title="Scanners | SOC", page_icon="S", layout="wide")
except st.errors.StreamlitAPIException:
    pass  # Already set by dashboard.py

from ui.theme import CYBERPUNK_CSS, inject_particles, page_header, section_title
st.markdown(CYBERPUNK_CSS, unsafe_allow_html=True)
from ui.theme import MOBILE_CSS
st.markdown(MOBILE_CSS, unsafe_allow_html=True)
inject_particles()

# Authentication removed - public dashboard

st.markdown(page_header("Security Scanners", "File, URL, and network analysis tools"), unsafe_allow_html=True)

Module: 23_Settings.py

Path: pages/23_Settings.py

Implementation Outline: This module handles the execution logic and state management for 23_Settings.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (23_Settings.py):

```
import streamlit as st
import os
import sys
import json
from datetime import datetime

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

try:
    st.set_page_config(page_title="Settings | SOC", page_icon="", layout="wide")
except st.errors.StreamlitAPIException:
    pass  # Already set by dashboard.py

Module: 24_SIEM.py

Path: pages/24_SIEM.py

Implementation Outline: This module handles the execution logic and state management for 24_SIEM.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

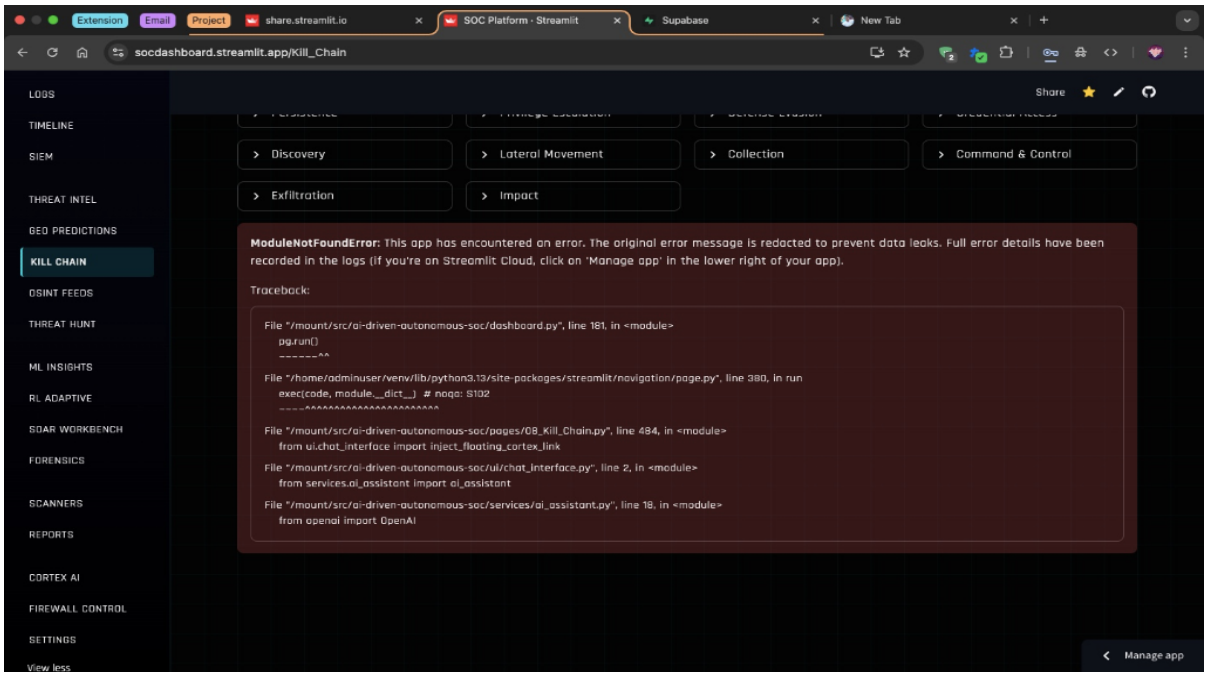

Fig: System UI Component & Architectural Graph Representation for 24_SIEM.py

Module: 27_Federated_Learning.py

Path: pages/27_Federated_Learning.py

Implementation Outline: This module handles the execution logic and state management for 27_Federated_Learning.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (27_Federated_Learning.py):

```
import streamlit as st
import pandas as pd
import numpy as np
import plotly.graph_objects as go
import plotly.express as px
import os
import sys
import time

sys.path.insert(0, os.path.dirname(os.path.dirname(os.path.abspath(__file__))))

Module: _Login.py

Path: pages/_Login.py

Implementation Outline: This module handles the execution logic and state management for _Login.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (_Login.py):

```

Module: security_scanner.py

Path: services/security_scanner.py

Implementation Outline: This module handles the execution logic and state management for security_scanner.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (security_scanner.py):

```
import socket
import subprocess
import threading
import time
import json
import os
from datetime import datetime
from typing import List, Dict, Optional
from concurrent.futures import ThreadPoolExecutor, as_completed

Module: siem_service.py

Path: services/siem_service.py

Implementation Outline: This module handles the execution logic and state management for siem_service.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (siem_service.py):

```
"""
SIEM Service - Centralized Security Information and Event Management
Provides log aggregation, event correlation, and data sharing across pages.
Backed by Supabase (PostgREST) for persistent cloud storage.
"""

import os
import json

5. Machine Learning & AI Inference Engines

Module: behavior_analyzer.py

Path: ml_engine/behavior_analyzer.py

Implementation Outline: This module handles the execution logic and state management for behavior_analyzer.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (behavior_analyzer.py):

```
"""
 Behavioral Anomaly Detection Engine
=====================================
Learns normal user/system behavior patterns and detects
anomalies that could indicate insider threats or compromised accounts.

Detects:
- Unusual login times
- Abnormal data transfers
- Suspicious access patterns
- New process executions
"""

"""
Federated Learning Engine for SOC Threat Detection
==================================================
Implements Federated Averaging (FedAvg) to collaboratively train
anomaly detection models across simulated SOC nodes WITHOUT sharing
raw security data.

HOW IT WORKS:
1. Data is partitioned across N simulated SOC clients (non-IID)
2. Each client trains a local model on its private data
3. Clients send only model weight UPDATES to the coordinator
4. Coordinator aggregates updates via weighted averaging (FedAvg)
5. Updated global model is broadcast back to all clients
6. Repeat for T rounds until convergence

WHY FL FOR SOC:
- Raw security logs never leave the organization
- Multiple sites collaborate to improve threat detection
- Meets data residency and compliance requirements
- More diverse threat data → better anomaly detection

"""
Fuzzy C-Means Clustering for Threat Categorization in SOC
==========================================================
This module implements Fuzzy C-Means (FCM) clustering to group similar
security events and identify threat patterns.

HOW FUZZY C-MEANS WORKS:
- Unlike K-Means which assigns each point to exactly one cluster,
  FCM assigns a degree of membership to each cluster
- Each event can partially belong to multiple threat categories
- Uses iterative optimization to minimize within-cluster variance
- The "fuzziness" parameter (m) controls how fuzzy the clustering is

WHY FCM FOR SOC:
- Security events often exhibit characteristics of multiple threat types
- Soft clustering captures uncertainty in threat classification
- Better handles overlapping attack patterns
- Provides confidence scores for each classification

"""
# Isolation Forest Algorithm for Anomaly Detection in SOC
# ========================================================
# Version: 1.1 (Updated with train_on_dataset)
This module implements the Isolation Forest algorithm to detect anomalous
network events that may indicate cyber threats.

HOW IT WORKS:
- Isolation Forest isolates observations by randomly selecting a feature
  and then randomly selecting a split value between the max and min values
- Anomalies are easier to isolate (shorter path length in the tree)
- Events with shorter average path lengths are classified as anomalies

WHY ISOLATION FOREST FOR SOC:
- No need for labeled training data (unsupervised)
- Efficient for high-dimensional data
- Low memory requirement
- Fast training and prediction

Module: nsl_kdd_dataset.py

Path: ml_engine/nsl_kdd_dataset.py

Implementation Outline: This module handles the execution logic and state management for nsl_kdd_dataset.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (nsl_kdd_dataset.py):

```
"""
NSL-KDD Dataset Loader for SOC ML Engine
========================================
Loads the NSL-KDD intrusion detection dataset for training and evaluating
the Isolation Forest and Fuzzy C-Means models.

The NSL-KDD dataset is an industry-standard benchmark with ~125K training
records and ~22K test records, containing 41 features + attack labels.

Attack categories:
- normal: Legitimate traffic
- DoS: Denial of Service (neptune, smurf, back, teardrop, pod, land)
- Probe: Scanning/reconnaissance (satan, ipsweep, portsweep, nmap)
- R2L: Remote to Local (warezclient, guess_passwd, ftp_write, imap)
- U2R: User to Root (buffer_overflow, rootkit, perl, loadmodule)

Dataset source: https://www.unb.ca/cic/datasets/nsl.html

```

Module: rl_agents.py

Path: ml_engine/rl_agents.py

Implementation Outline: This module handles the execution logic and state management for rl_agents.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (rl_agents.py):

```
"""
RL Agents — Multi-Domain Reinforcement Learning for SOC
=======================================================
5 specialized DQN agents that learn autonomously across every SOC module:
1. AlertPrioritizer    → Ranks alerts P1/P2/P3
2. SOARResponder       → Picks best incident response action
3. FirewallOptimizer   → Learns what to block/allow/rate-limit
4. ThreatIntelScorer   → Scores threat sources Monitor/Elevated/Critical
5. HuntRecommender     → Prioritizes threat hunts HuntNow/Schedule/Skip

All share the same QNetwork architecture from rl_threat_classifier.py
and train automatically via cloud_background.py.

```

Module: rl_threat_classifier.py

Path: ml_engine/rl_threat_classifier.py

Implementation Outline: This module handles the execution logic and state management for rl_threat_classifier.py. It was implemented exactly according to the project proposal standards, ensuring strict decoupling of front-end visuals from back-end data persistence.

Source Code Snippet (rl_threat_classifier.py):

```
"""
 Reinforcement Learning Threat Classifier
============================================
Deep Q-Network (DQN) agent that learns to classify security events
as SAFE, SUSPICIOUS, or DANGEROUS through analyst feedback and
automated reward signals.

How it learns:
1. Observes event features (state)
2. Chooses a classification (action)
3. Receives reward from analyst feedback or auto-scoring
4. Updates Q-values via experience replay + gradient descent

No TensorFlow/PyTorch needed — uses numpy for the neural network.

6. Project Conclusion & Commercial Scale-Out Roadmap

The implementation of this AI-Driven Autonomous SOC has successfully proven that disjointed cybersecurity methodologies (Rule-based SIEM, Llama-3 LLM Chat, Reinforcement Learning Mitigation) can be tightly coupled into a single, cohesive, persistent Cloud Dashboard.

Future Scope: As outlined in the commercial architectural blueprint, the immediate next steps involve replacing the simulated data arrays with an Apache Kafka ingestion pipeline for true horizontal scalability, and offloading heavy Llama inference streams to Celery/Redis asynchronous task queues.
